Fix: iCloud Setup Error "Your computer is missing Media features"

When you attempt to install Apple iCloud cloud storage client software on your Windows PC, the following error may occur:

Your computer is missing Media features.
Please download Media Features Pack
for Windows from Microsoft and install
and try again.

Fix iCloud Error: Your computer is missing Media features

To fix the problem, enable Media Features via Windows Features dialog box using these steps:

1. Right-click Start, click Run.
2. Type `optionalfeatures.exe` and click OK.
3. In the Windows Features dialog that opens, place a tickmark near "Media Features" option to enable it.

[Remove 3D Objects Folder from This PC in Windows 10](#)

[How to Enable Blue Light Reduction in Windows 10?](#)

[Restore or Reinstall Windows Store in Windows 10 after uninstalling it with PowerShell](#)

4. Click OK, and restart Windows.

Note: You can also add Media Features / Windows Media Player via Settings UI in Windows 10. If you receive the error `0x800F0821` when trying to add the Windows

Media Player, temporarily disable your antivirus software before adding WMP again. Avira antivirus software seems to cause the problem, as reported by some users.

"Media Features" is missing? For Windows N & KN versions, you'll not see the option "Media Features" in the Windows Features dialog. For those editions, you'll need to download the Media Features Pack manually. See post [Where is Windows Media Player in Windows 10?](#) for more information and download links.

After enabling or installing Media Features, attempt to install iCloud now. If the error occurs again, there is a registry fix you can apply to resolve the issue.

1. Right-click Start, click Run.
2. Type `regedit.exe` and click OK.
3. Goto the following registry branch:

`HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Wi`

4. In the right-pane, double-click `(default)` and set the media version accordingly.

To find the media version, open Windows Media Player and check the "about" dialog for the exact version number and build. In my system, the build number is 12.0.16299.64 as reported by WMP. In that case, set the (default) value data in the registry to `12.0.16299.64` if it's not already set. However, for some [users](#), simply setting the `(default)` value data to `1` worked anyway.

Apparently, some [websites](#) suggest that you can install iCloud for Windows 10 (which is missing Media features) merely by employing the above registry edit.

2 thoughts on "Fix: iCloud Setup Error "Your computer is missing Media features""

Piotr Chylarecki

I do have the "Windows media features" in "Optional system features manager" (and turning it on and off didn't help). I didn't even have the last two keys of that registry path.

I created them and set the last one's value to just "1" and the iCloud installer didn't display the error and succeeded this time around.

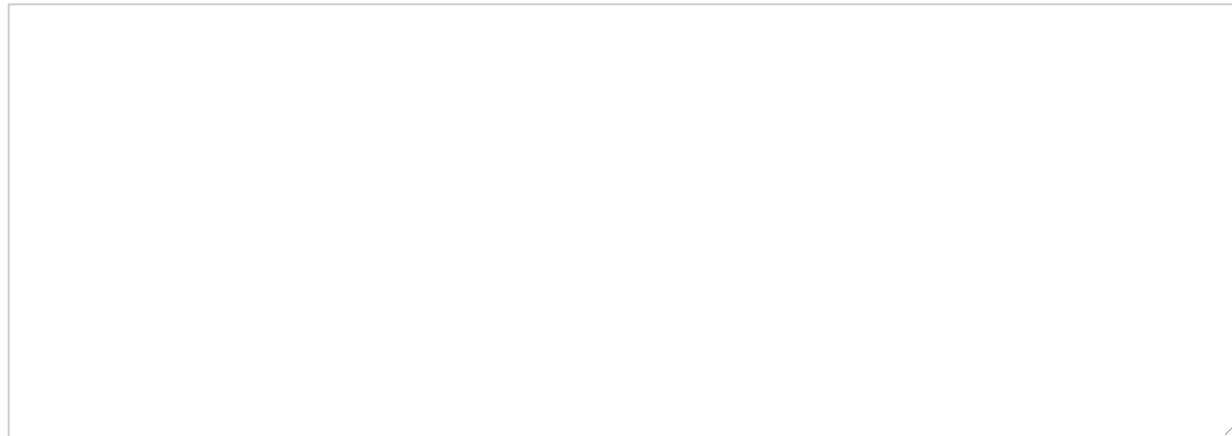

Thank you for the tip!

JP

Piotr, well done. I had spent some time figuring this out. Installing packs and turning media features on and off didn't do the trick. Creating the two reg entries worked! Thanks.
